

## Solvita Soil Respiration Test at Logan Labs

Logan Labs is proud to add the Solvita Soil Respiration Test to our list of analytical tools. The Solvita Soil Respiration Test is a measurement of soil microbial activity and an estimate of N-Mineralization.

The Solvita Soil Respiration Test is a 24 hour process that measures the CO<sub>2</sub> burst that occurs when a dried soil is re-moistened to field capacity.

Please check out our “Customer Tools” tab for more information about the Solvita Test and interpretations.
